

Lab 4 — VibeCoding Chat History

Project: Whack-a-Mole Game

Assigned repository: SETAPESU26/48_whack-a-mole

Personal repository: arnavchoudhary141/whack-a-mole

Assignment: Lab 4 — VibeCoding

USER

Provided the assigned GitHub repository: SETAPESU26/48_whack-a-mole.

ASSISTANT

Reviewed the Lab 4 handout. The workflow requires cloning the assigned repo, running the Python game, recording a 10-second before video, fixing the broken code and adding README features one by one, recording a 10-second after video, and pushing the work to a personal repository without raising a PR to SETAPESU26.

USER

Provided the Whack-a-Mole README. It listed four tasks: refine collision detection; implement a Game Over screen; add replay with Easy, Medium, or Hard difficulty; and add sound feedback.

USER

Installed the requirements successfully, but python was not found.

ASSISTANT

Explained that python3 should be used on macOS and instructed the user to run python3 main.py.

USER

Ran the original game and completed the required before video.

ASSISTANT

Started Task 1: collision detection. The fix was designed so one mouse click can process at most one hole when neighboring hitboxes overlap.

USER

Requested that complete file contents be provided instead of partial code.

ASSISTANT

Adjusted the workflow to provide complete file contents for each task.

USER

Encountered an ImportError after an incorrect partial file replacement.

ASSISTANT

Restored game/game_engine.py with git checkout -- game/game_engine.py and restarted the task cleanly.

ASSISTANT

Provided the complete game/game_engine.py for Task 1, preserving the GameEngine class and implementing single-hit collision handling.

USER

Confirmed Task 1 was done.

ASSISTANT

Provided the complete game/game_engine.py for Task 2. It added a visible Game Over screen with the final score and graceful input handling.

USER

Confirmed Task 2 was done.

ASSISTANT

Provided the complete game/game_engine.py for Task 3. It added replay and Easy/Medium/Hard difficulty selection with different mole spawn and duration settings.

USER

Confirmed Task 3 was done.

ASSISTANT

Provided the complete game/game_engine.py for Task 4. It added separate sound feedback for successful whacks, missed clicks, and the round ending using Pygame-generated sounds.

USER

Confirmed Task 4 was done.

ASSISTANT

Started the final submission process: record the after video, create the personal GitHub repository, change the remote, commit, and push the completed code.

USER

Provided the personal GitHub repository: arnavchoudhary141/whack-a-mole.

USER

Successfully pushed the completed code to the personal repository. The terminal showed main -> main and origin/main tracking.

ASSISTANT

Created the Lab-4 submission structure containing the before video, after video, and chat history.

USER

Discovered that the first uploaded video files were text files containing local file paths rather than actual videos.

ASSISTANT

Located the two real Mac screen recordings in Documents and instructed the user to copy them into Lab-4.

USER

Confirmed that the real recordings were copied. The before video was approximately 3.0 MB and the after video approximately 5.0 MB.

ASSISTANT

Identified that the chat-history PDF was only 49 bytes and therefore needed to be replaced with a valid PDF.

Completed Lab 4 tasks

1. Collision detection refined so a single click cannot score twice.
2. Game Over screen added with final score and input handling.
3. Replay option added with Easy, Medium, and Hard difficulty.

4. Sound feedback added for successful whacks, missed clicks, and round ending.

Submission artifacts

before.mp4 — original gameplay recording.

after.mp4 — completed gameplay recording.

chat-history.pdf — this exported Lab 4 conversation record.
