

Lab 4 — VibeCoding Chat History

Project: Whack-a-Mole Game

Repository: arnavchoudhary141/whack-a-mole

Prompt 1 — Fix Collision Detection

User: I am working on the Pygame Whack-a-Mole project. Fix Task 1 from the README. A single mouse click can sometimes award two points when neighboring mole hitboxes overlap. Refine the collision detection so one click can score at most one point. If multiple hitboxes contain the click, select the closest matching hole and process only that hole. Preserve the existing game behavior and do not implement the other tasks yet.

Prompt 2 — Game Over and Replay

User: Implement Tasks 2 and 3 from the README. When the round timer reaches zero, display a proper Game Over screen showing the final score instead of only printing to the console. Then allow the player to replay by choosing Easy, Medium, or Hard difficulty, with different mole spawn/speed settings for each difficulty. Also allow the player to exit. Preserve the existing collision fix and game structure.

Prompt 3 — Sound Feedback and Finalization

User: Implement Task 4 from the README and complete the game. Add separate basic sound feedback for a successful whack, a missed click, and the round ending. Preserve Tasks 1–3, keep the game functional, and make sure the final version can be tested normally with `python3 main.py`. After completing the changes, prepare the project for submission with the before/after gameplay videos and chat history.

Result: Collision detection was refined, a Game Over screen was added, replay and difficulty selection were implemented, sound feedback was added, and the completed project was pushed to the personal GitHub repository.
